

There are two software solutions available for managing CyberLock deployments: CyberAudit® Professional, designed for small- to mid-sized businesses, and CyberAudit Enterprise, designed for large, geographically widespread customers. Both software systems allow users to expand their system as they grow.

CyberAudit Professional

CyberAudit Professional is designed with the small- to mid-sized business in mind. Professional allows users to set key expirations and assign access to specific locks. With a simple matrix design of locks, keys, and access schedules, the security of your facility is easily managed. Professional also offers email notifications, blocking a lost key, and grouping together locks, people, and/or access permissions.

Professional is designed for installations of approximately 500 locks, 500 keys, and 5 concurrent software users. Professional comes preloaded on the CyberAudit SP-100 server or can be installed on a computer or server. In addition to the Professional software, a complete system includes CyberLock electronic cylinders, CyberKey programmable keys, a Grand Master, and one or more communication devices.

CyberAudit Enterprise

CyberAudit Enterprise is a feature-rich management software platform ideal for large and/or geographically widespread installations. Enterprise is packaged on a server and offers all the features of Professional as well as advanced options like shared locks, programming any key with temporary access for a specific user, and the ability to operate one cohesive system across multiple time zones. Enterprise provides significant capacity that can easily manage 15,000 locks, 15,000 keys, and 500 concurrent users.

Users can easily access the software from any work station that is connected to a local network or the internet by opening a web browser and logging on. To assist with the management of the CyberLock database, a hierarchy of administrators can be set, allowing each manager control over the locks, keys, and people in their functional area.
